

01 PORTFOLIO COMPANY REVIEW

Biota, Inc.

Progress vs. Plan

Biota, Inc. is an environmental diagnostics company commercializing two complementary PFAS monitoring products: **MagnaPrep**, a magnetic-nanoparticle sorbent that replaces cartridge-based solid-phase extraction in laboratory sample prep, and **RapidTest**, a fluorescence-displacement screening kit that returns a total-PFAS result in about twenty minutes on an off-the-shelf fluorimeter. Both were soft-launched in early 2026. The company is led by CEO Rose Nash, PhD, and operates an LC-MS/MS laboratory in Colorado. This report benchmarks Biota against its own stated plan, drawn from its data room, so that progress each quarter can be verified rather than narrated.

COMPANY 2029 REVENUE PLAN

Q4 2027

PLANNED BREAKEVEN QUARTER

HOW TO USE THIS TRACKER

This is a static benchmark of Biota's own stated plan, fixed at the close of its March 2026 data room. Each quarter, read Section 03 for the revenue figure and milestones the company committed to for that period and verify each against evidence — invoices, signed contracts, installed-system counts, validation reports — rather than narrative. Sections 04 and 05 hold the cash, pipeline, and ownership math those results feed into. The plan recorded here does not update; deviations from it are the signal.

WHAT BIOTA SELLS

- **MagnaPrep** — \$450 per bottle, 30 samples per bottle (~\$15/sample), 80% target gross margin. Replaces WAX SPE cartridges (\$12–25/sample) while remaining compatible with existing LC-MS/MS workflows.
- **RapidTest** — \$500 per kit, 84% target gross margin, bundled with a ~\$2,500 fluorimeter. Positioned at ~\$10 per test against ~\$300–500 per sample for EPA Method 1633 lab analysis.
- Revenue model is consumables-led: instruments are the entry point, reagent reorders are the recurring line.

MATERIALS REVIEWED

Product Overview & Technical Brief · Technology & Product Development Roadmap (overview + key milestones) · 3-Year Financial Projections with Sensitivity Analysis · Model of Projected Financials (incl. 2025 actuals) · Sales Pipeline · Go-to-Market Plans for MagnaPrep and RapidTest · Competitive Landscape · Strategic Position & Exit Landscape · Evidence of Commercial Traction (customer correspondence).

Source materials are confidential to Biota, Inc. This summary is written at the level of progress-against-plan and omits proprietary technical detail the company holds under NDA.

02 SECTION 02

Technology & Validation Position

MAGNAPREP — COMPANY-STATED PERFORMANCE

- Over 200 nanoparticle formulations screened; dual head- and tail-binding chemistry selected on measured PFOA extraction efficiency.
- **>80% recovery across all PFAS tested**, including short-chain compounds. The comparison that matters commercially: PFBA (C4) recovery is reported at ~2% by conventional WAX SPE versus >80% by MagnaPrep.
- Throughput claim of up to ~90× versus manual SPE (8 samples/technician/day to a stated 216–720/day), implying ~\$48 labor saving per sample and ~\$578K annual labor saving for a lab running 1,000 samples/month.
- Silica-coated particles sourced from Zymo Research, an early investor and strategic partner — a supply relationship worth confirming is contractual, not informal.

COMPETITIVE MOAT AS CLAIMED

Biota states it is not aware of commercial competitors developing magnetic nanoparticle extraction for PFAS analytical workflows. Incumbent consumable suppliers (Waters, Agilent, Thermo Fisher, Phenomenex) would need nanoparticle manufacturing and proprietary surface chemistries to replicate it. Automated SPE systems (\$300–350K capital) automate the cartridge rather than replace it.

RAPIDTEST — VALIDATION SCORECARD

Pre-commercial validation against the company's own predefined acceptance criteria:

CRITERION	RESULT
Sensitivity (LOD)	5 ppb PFOA vs. ≤30 ppb target
Calibration curve	Average $r^2 \geq 0.9993$ vs. ≥ 0.95 target
Precision	~1–2% RSD vs. ≤30% target
Class coverage	11 of 13 PFAS detected vs. ≥80% target
Drinking / surface water	Recovery within tolerance
Wastewater / soil	Data collection in progress

Kit is labelled Research Use Only. Cloud analysis tool performs curve fitting and QC.

TWO TECHNICAL GAPS TO TRACK

- The two non-detects are **PFBA (C4)** and **GenX** — both regulated compounds. Company notes ongoing work to improve C4 reactivity; ask each quarter whether it has closed.
- **Wastewater and landfill leachate performance is unproven.** Those matrices are what the 2027–2029 revenue ramp is sold on, and they depend on the MagnaPrep–RapidTest integration reaching ppt-level sensitivity. Treat that integration as the single most important technical milestone in the plan.

03 SECTION 03

Quarterly Target Tracker — Company-Styled Plan

Revenue figures are the company's own quarterly model (the case it labels "Conservative"). Milestones are drawn from its development roadmap and go-to-market plans. These are Biota's commitments — the checkpoints BUW will verify each quarter.

QUARTER	REVENUE TARGET	COMPANY-STATED MILESTONES	WHAT BUW VERIFIES
Q3 2026	\$33K	MagnaPrep Phase 1 selling to remediation companies; RapidTest Phase 1 in PFAS treatment-technology market · Manufacturing scale-up on lyophilized reagents · Hire Chief Marketing & Commercial Officer post-seed	First reagent reorders (not just instrument placements); CMCO hired; scale-up capacity evidenced
Q4 2026	\$81K	Pilots convert to paying accounts · EPA Method 1633-aligned validation studies · MagnaPrep–RapidTest integration for ppt sensitivity (drinking water use case) · Crude-matrix R&D (leachate, wastewater)	Named paying customers vs. unpaid pilots; validation report issued; matrix data
Q1 2027	\$184K	MagnaPrep Phase 2 opens: Tier-2/3 commercial testing labs · RapidTest Phase 2: contamination-monitoring market	Count of Tier-2/3 labs onboarded; revenue mix shifting to consumables
Q2 2027	\$388K	Elution procedure to differentiate short/medium/long-chain PFAS · Microplastics feasibility studies begin	Chain-differentiation capability demonstrated; platform spend not crowding out PFAS execution
Q3 2027	\$523K	MagnaPrep Phase 3 begins: first Tier-1 national laboratory network · Protocols for automated high-throughput workflows	Tier-1 contract signed (Eurofins, SGS, Pace or ALS class of account)
Q4 2027	\$957K	Planned breakeven quarter — first positive net income · 24-month commercial goals due: 10–15 RapidTest systems installed; 20–30 MagnaPrep lab customers	Actual net income; installed-base and customer counts against those two targets
Q1–Q2 2028	\$993K / \$1.69M	Microplastics prototype development · PFAS speciation (Raman) feasibility · Selection of two additional analyte targets	Whether revenue run-rate supports the Series A story the plan depends on
Q3 2028	\$2.21M	Series A of \$6M assumed in the model this quarter · Personnel step-up from \$210K to \$375K per quarter	Round raised, terms, and BUW pro rata window; headcount plan funded
Q4 2028	\$2.75M	Microplastics validation pilots with wastewater utilities	Trajectory into 2029 plan of \$23.5M

Read the shape, not just the numbers. Roughly 70% of the four-year plan lands in 2029, and its largest line — RapidTest operational monitoring — is a 0.5–4% share of a stated \$499M market that does not meaningfully exist until federal compliance deadlines arrive. The quarters that actually test the business are Q4 2026 through Q4 2027.

04 SECTION 04

Financial Plan, Cash & Sensitivity

THE PLAN, YEAR BY YEAR

YEAR	REVENUE	OP EX	NET INCOME
2026	\$114K	\$720K	(\$626K)
2027	\$2.05M	\$2.04M	(\$347K)
2028	\$7.64M	\$2.43M	\$3.78M
2029	\$23.46M	\$2.82M	\$16.51M

Gross margin held at ~82% blended throughout. 2026 covers two quarters of modelled operation.

CASH POSITION AS STATED (MARCH 2026)

- Cash on hand **\$301K**; committed non-dilutive **\$158K** (Great Lakes Innovation award \$100K; Colorado grant \$58K)
- Monthly burn **~\$72K**
- Pending, not committed: NIEHS SBIR Phase 1 (\$307K, fundable score), Colorado Equity Retention Grant (\$250K), NIEHS SBIR Phase 2 (\$2M, May 2026 submission), Morgan Stanley program finalist (\$150K)
- 2025 actuals: ~\$875K total expenses against \$443K grant income — a \$428K net loss, meaning non-dilutive funding covered roughly half the year's spend

SENSITIVITY — COMPANY'S OWN SCENARIOS

2029 SCENARIO	MAGNAPREP	RAPIDTEST	REVENUE
Conservative	5% share	1% share	~\$10M
Base case	10%	2.7%	~\$30M
Upside	15%	4%	~\$45M+

Against stated 2029 SAMs of \$90M (MagnaPrep sample prep) and \$1.24B (RapidTest monitoring).

REALITY-CHECK FLAGS

- **Runway is the near-term question.** \$301K on hand plus \$158K committed against ~\$72K monthly burn is roughly six months absent new capital — and the model's own opening balance assumes \$3M in the bank. Confirm the seed proceeds landed and what the post-close burn actually is.
- **Burn steps up sharply in the plan.** Modelled operating expense of \$360K per quarter in late 2026 rising to \$510K in 2027 is well above the stated ~\$216K quarterly burn. The plan therefore assumes hiring that has to be funded before the revenue arrives.
- **The labels don't line up.** The workbook's "Conservative Model" produces \$33M by 2029 — but the sensitivity deck calls ~\$30M the base case and ~\$10M conservative. Anchor governance conversations to the \$10M downside case, not the model's default.
- **Breakeven depends on Tier-1 lab entry.** The Q4 2027 crossover requires MagnaPrep Phase 3 national-network revenue starting mid-2027. No Tier-1 agreement exists yet; those accounts are in the pipeline at prospect stage.

05 SECTION 05

Commercial Traction, Capital & Exit Lens

SALES PIPELINE AS REPORTED (MARCH 2026)

MEASURE	VALUE
Total opportunities	21
Unweighted pipeline	~\$243K
Weighted pipeline	~\$145K
Closed revenue to date	~\$4K (Cornelsen UK)
Largest single opportunity	\$150K AECOM ESTCP contract, weighted at 65%

Five opportunities are marked won, but four are unpaid pilots (CDM Smith ×2, AECOM, Aclarity). Real booked revenue is a single instrument-and-reagent order. Cornelsen has signed an MOU covering European distribution and has introduced Biota to Parsons; AECOM's PFAS chemistry lead is benchmarking price against rush lab analysis.

The metric that matters: the ESTCP award alone is more than the entire 2026 revenue plan. Its outcome, and the pilot-to-paid conversion rate behind it, tell you more than any other number this year.

CAPITAL & OWNERSHIP

ROUND	TERMS
Series Seed	\$12M post-money, led by Burnt Island Ventures (Steve Kloos); BUV participated
Non-dilutive	\$443K grant income recognised in 2025; further awards pending
Series A	\$6M assumed in the model, Q3 2028

Dilution math. A \$6M Series A at a \$30M post would dilute existing holders ~20%; at \$24M post, ~25%. For every 1.0% held today, that is a drift to roughly 0.80% or 0.75% respectively unless BUV takes its pro rata. Information rights are already documented via side letter with the CEO, giving quarterly financials and cap-table updates — use them to keep this page current.

EXIT LENS (BUV SIX: NAMED PLAUSIBLE EXIT)

The company names three acquirer classes and has real contact in two of them: water technology platforms (Veralto has visited the facility twice; Xylem and Teledyne ISCO in early conversations), analytical instrumentation and sample-prep suppliers whose cartridge revenue MagnaPrep displaces (Waters, Agilent, Thermo Fisher, Phenomenex), and high-volume testing laboratories (Eurofins, SGS, Pace, ALS). Zymo Research sits inside the cap table as strategic partner. Private-equity interest is noted from Valor Capital Group.

BUV QUARTERLY REVIEW CHECKLIST

- Revenue this quarter against the Section 03 figure — and how much of it is recurring consumables?
- Cash on hand, current burn, and months of runway?
- How many unpaid pilots converted to paying accounts?
- Installed RapidTest systems and MagnaPrep lab customers vs. the 10–15 and 20–30 targets?
- Wastewater and leachate validation — closed or still in progress?
- Grant decisions received, and any Tier-1 laboratory agreement signed?
